Art Unit: 1764

Election/Restrictions

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- Claims 1-21, drawn to a compact, continuous-flow distillation system, classified in class 202, subclass 181.
- II. Claim 22 drawn to a double container boiler vessel, classified in class 122 subclass 459
- III. Claims 23-24, drawn to a noninvasive sensor, classified in class 137, subclass 386.
- IV. Claims 25-30, drawn to a condenser, classified in class 165, subclass 110.The inventions are distinct, each from the other because of the following reasons:

Inventions!, II and III are related as combination and subcombination. Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP § 806.05(c)). In the instant case, the combination as claimed does not require the particulars of the subcombination as claimed because the distillation system can be manually controlled e.g., by a sight glass for level control, therefore not requiring the sensor indicated in group III invention. Likewise, the system of group I can use a single boiler and not requiring the double boiler of group II invention. The subcombination has separate utility such as controlling level in a process of making or manufacturing industrial or commercial products.

'Application/Control Number: 10/086,554

Art Unit: 1764

Inventions I, II, III and IV are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case, the different inventions have different modes of operations. The group I invention are directed to a distillation system involving the process of evaporation and condensation; whereas, group 1V is directed to a condenser only. The group III invention is directed to a sensor for controlling purposes; and group II to a boiler for steam generation and not to an evaporator and condenser, unlike e.g., in the group I invention.

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification; the search required for Group I, II, III is not required for Group IV, and vice versa; and have acquired a separate status in the art because of their recognized divergent subject matter, restriction for examination purposes as indicated is proper.

Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Virginia Manoharan whose telephone number is 703-308-3844. The examiner can normally be reached on Tuesday-Friday; 7:30AM-6:00PM.
